## **DETAILED ACTION**

Acknowledgement is made of the receipt and entry of the amendment filed 10-20-97.

Applicant's arguments have been fully considered but they are not persuasive. Applicant seems to contend that the Markowicz reference does not teach that dendritic precursors when exposed to GM-CSF will proliferate into dendritic cells, the examiner disagrees. The teachings of Markowicz and the motivation to apply the teachings was set forth many office actions ago. It is true that the child case has been allowed, applicant is invited to call the undersigned examiner to set up an interview and determine allowable subject matter.

The following is a quotation of 35 U.S.C. § 103 which forms the basis for all obviousness rejections set forth in this Office action:

A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Subject matter developed by another person, which qualifies as prior art only under subsection (f) or (g) of section 102 of this title, shall not preclude patentability under this section where the subject matter and the claimed invention were, at the time the invention was made, owned by the same person or subject to an obligation of assignment to the same person.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. § 103, the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to

Serial Number: 08/261,537 Page 3

Art Unit: 1808

the contrary. Applicant is advised of the obligation under 37 C.F.R. § 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of potential 35 U.S.C. § 102(f) or (g) prior art under 35 U.S.C. § 103.

Claims 1-6 & 8-12 are rejected under 35 U.S.C. § 103 as being unpatentable over Markowicz et al. in view of Jakoby et al.

Markowicz et al., relied upon for the reasons discussed in the previous office action, teach utilization of 100 U/ml of GM-CSF and IL-4. Markowicz et al. differs from the claimed invention by not specifically indicating the exact concentration level of IL-4 utilized and also by teaching the utilization of a slightly less concentration level of GM-CSF from that which is specifically claimed. However, it is well known in the art to adjust the concentration level of culture medium additives in order to optimize the experimental conditions for the particular cell type being cultured.

Jakoby et al., on pages 75-77, teach that it is well known in the art of cell culture to "tailor media" in order to optimize the experimental conditions. Each culture system requires examination of the particular conditions that are best for the type of cell being studied by the investigator.

Furthermore, each component of the system, identified as result-effective variables, has its well recognized advantages for the purpose of optimizing the experimental conditions. This type of optimizing experimental conditions is well within the purview of the skilled artisan and is deemed a matter of routine experimentation.

Art Unit: 1808

Accordingly, the claimed invention would have been *prima facie* obvious to one of ordinary skill in the art at the time the claimed invention was made, especially in the absence of sufficient, clear and convincing evidence to the contrary.

Claims 7 and 13 are rejected under 35 U.S.C. § 103 as being unpatentable over Markowicz et al in view of Jakoby. as applied to claims 1-6 and 8-12 above, and further in view of Koch et al.

Markowicz et al. differs from claim 7 by not specifically teaching that the culture medium may further comprise TNF-alpha.

Koch et al teach that new insight into the biology of dendritic cells (DC) came from studies of murine epidermal Langerhans cells (LC) *in vitro*. Koch et al. indicate that such studies have suggested that LC in the skin and DC in other non-lymphoid tissues represent precursors or immature elements of the dendritic cell system. Koch et al. teaches that the addition of TNF-alpha to murine epidermal Langerhans cells in culture allows such cells to maintain their viability. Therefore, in view of the teachings of Koch et al., one of ordinary skill in the art would have a reasonable expectation of success in maintaining viability of dendritic cells when TNF-alpha is added to a dendritic cell culture. Accordingly, one of ordinary skill in the art would have had a reasonable expectation of success in adding TNF-alpha to the dendritic cell culture of Markowicz et al.

Serial Number: 08/261,537 Page 5

Art Unit: 1808

Claims 8-9 and 23 are rejected under 35 U.S.C. § 103 as being unpatentable over Markowicz et al. In view of Jakoby as applied to claims 1-6 and 8-12 above, and further in view of Voorhis et al or Ruley et al.

Markowicz et al. differs from claims 8-9 and 23 by adding 10% heat-inactivated human serum as opposed to 1-15% fetal calf serum or 5% cord blood serum. However, Voorhis et al teach that human dendritic cells may be cultured in 5-10% fetal calf serum. Furthermore, it is well known in the animal cell culture field to utilize cord blood serum in animal cell cultures. *See, e.g.*, Ruley et al., U.S.Patent No. 5,364,783, column 22, lines 21-27. Therefore it is deemed merely a matter of judicious selection on the part of the skilled artisan to utilize fetal calf serum or cord blood serum as opposed to human serum. Additionally, it is well known in the art to utilize anywhere from 1-20% of serum in animal cell cultures. Utilization of a particular concentration within that range is deemed merely a matter of routine optimization which is well within the purview of the skilled artisan.

Accordingly, the claimed invention would have been *prima facie* obvious to one of ordinary skill in the art at the time the claimed invention was made, especially in the absence of sufficient, clear and convincing evidence to the contrary.

No claim is allowed.

1. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Serial Number: 08/261,537 Page 6

Art Unit: 1808

A shortened statutory period for response to this final action is set to expire THREE MONTHS from the date of this action. In the event a first response is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event will the statutory period for response expire later than SIX MONTHS from the date of this final action.

- Accordingly, the claimed invention was prima facie obvious to one of ordinary skill 2. in the art at the time the invention was made especially in the absence of evidence to the contrary.
- 3. Any inquiry concerning this communication or earlier communications from the examiner should be directed to L. Blaine Lankford whose telephone number is (703) 308-2455.
